

Intrusion Detection in High-Speed Networks: From Packets to Flows and Back

Falko Dressler

Network Monitoring

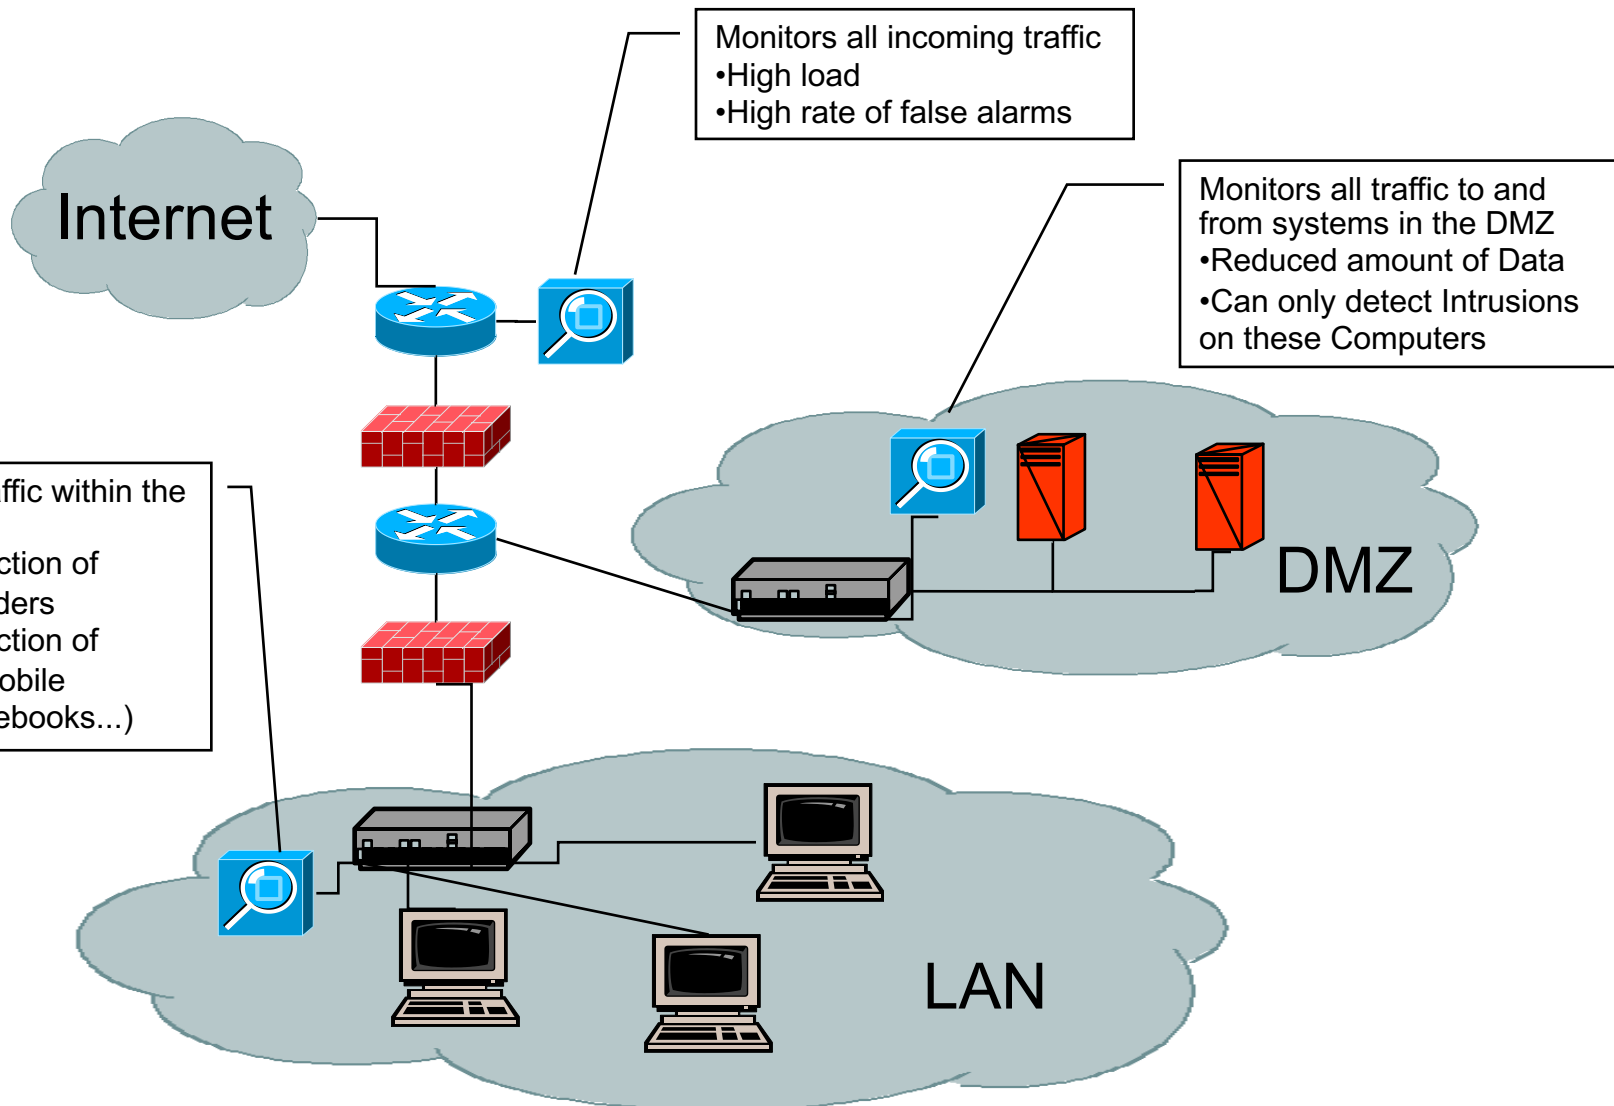

Network Monitoring

- Observing network traffic for:
 - Analysis (performance, statistics, troubleshooting, accounting)
 - Intrusion detection
 - Attack prevention
 - ...

Intrusion Detection

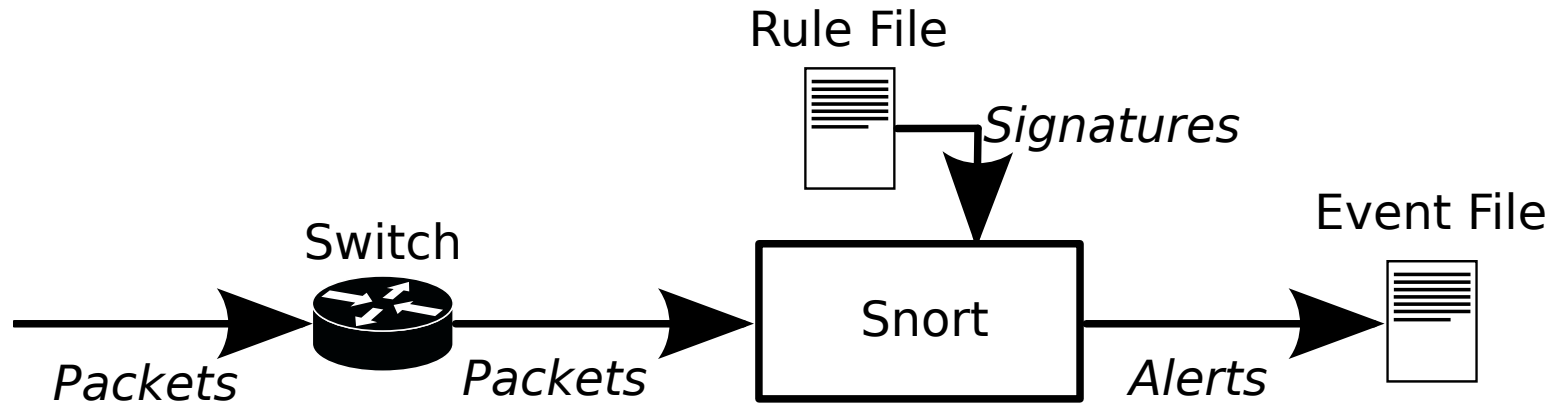

Placement of a Network Intrusion Detection System

Network Intrusion Detection Systems (IDS)

- Analyze network traffic for malicious activity
- Anomaly-based IDS
 - Have a model of 'normal' traffic
 - Detect and alert deviations from 'normal' traffic
 - + all sorts of attacks
 - – higher false positive rate
- Signature-based IDS
 - Have rule-set of known attacks and incidents
 - If packet/stream satisfies rules alarm is triggered
 - + low false positive rate
 - – no novel attacks
 - → Example: Snort

Signature-based IDS: Snort

- Signature analysis is very performance hungry:

1. Decoding of packets
2. Preprocessing data
3. Detection phase

- **Snort with 5000 rules can handle 130k pkts/s**

Signature-based IDS: Snort

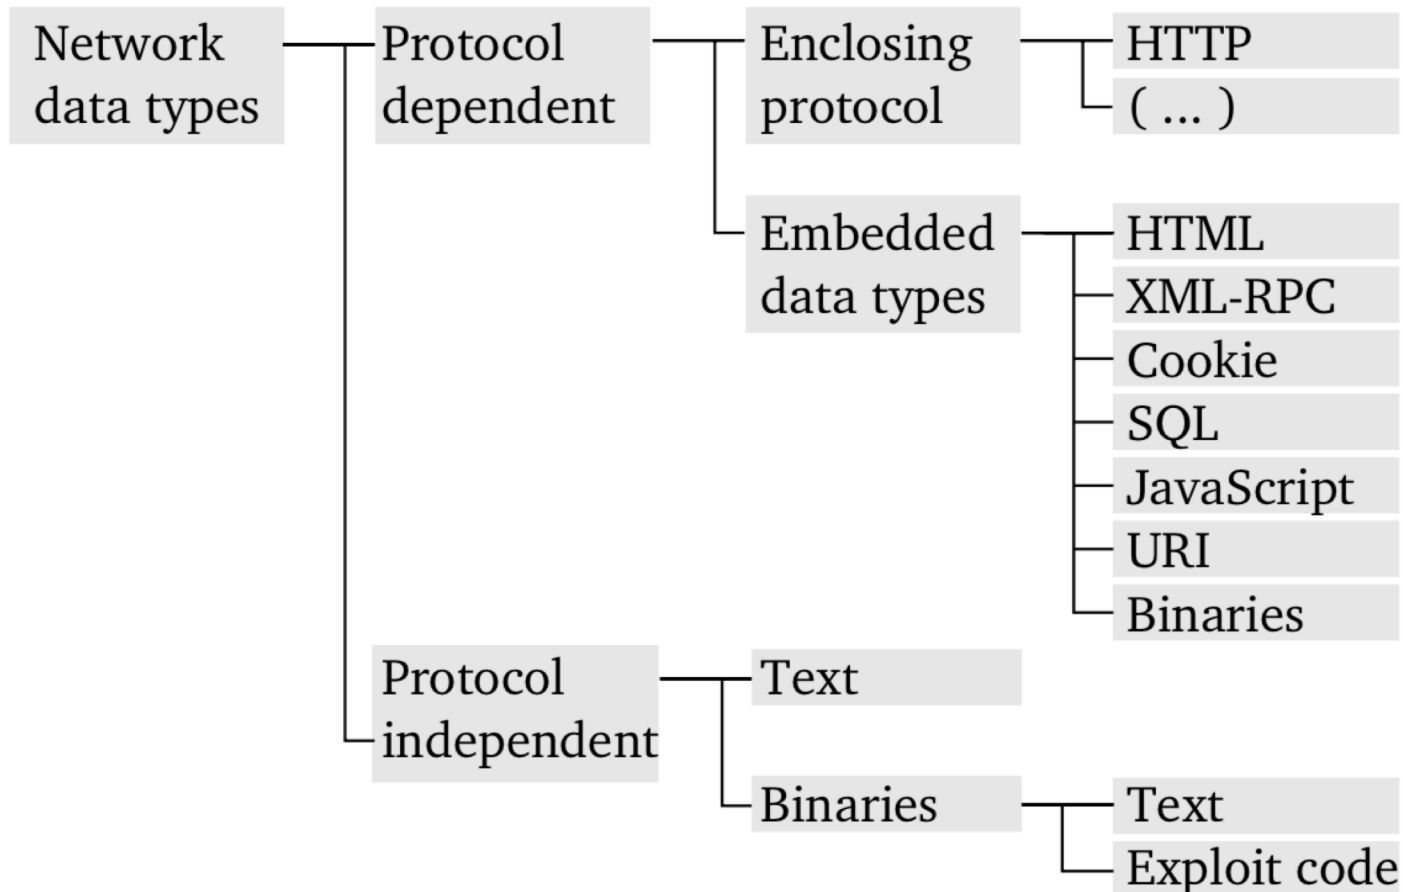

- Mainly signature based, each intrusion needs a predefined rule

```
alert tcp $HOME_NET any -> any 9996 \  
  (msg:"Sasser ftp script to transfer up.exe"; \  
  content:"|5F75702E657865|"; depth:250; flags:A+; \  
  classtype: misc-activity; sid:1000000; rev:3)
```

- Three step processing of captured information (capturing is done by libpcap):
 - Preprocessing (normalized and reassembled packets)
 - Detection Engine works on the data and decides what action should be taken
 - Action is taken (log, alert, pass)

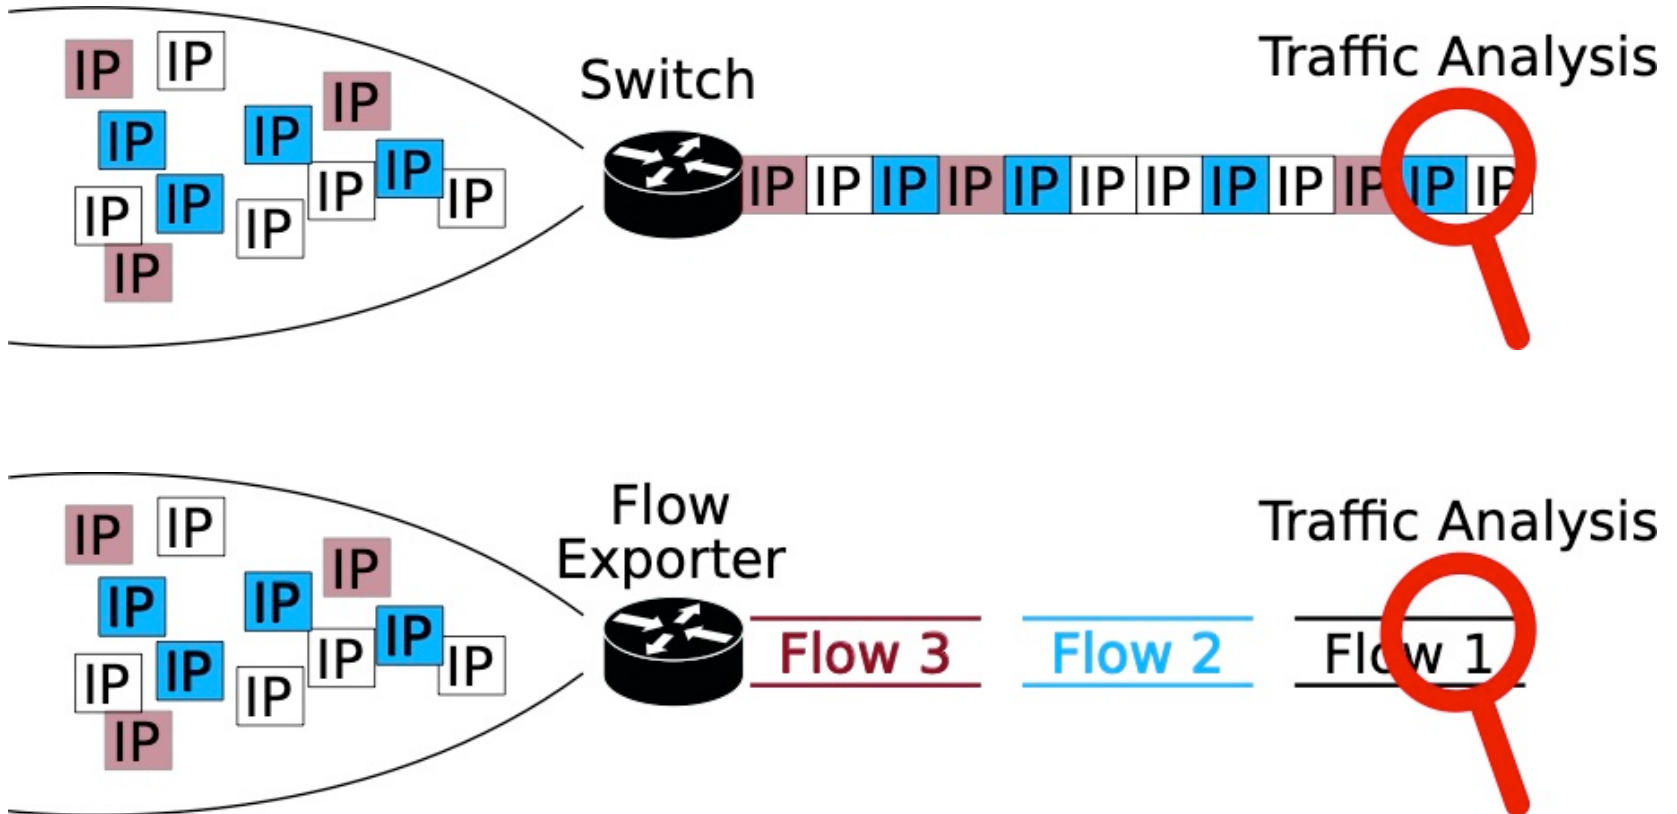

Signature-based IDS: Snort

- Rule processing

From Packets to Flows

From Packets to Flows

Flow-based Traffic Analysis

- Flows are “condensed” network traffic data
- Packets with same properties go into same Flow
- IPFIX supported by most industry grade switches
- Flow fields are configurable

IPFIX: IP Flow Information Export

- Example IPFIX Flow Record:

```
+--- Ipfix Data Record (id=999)
'- sourceIPv4Address           :10.0.2.15
'- destinationIPv4Address      :93.184.216.34
'- sourceTransportPort         :50488
'- destinationTransportPort    :80
'- packetTotalCount            :13
'- octetDeltaCount              :2304
+---
```

Flow-based IDS

Signature-based Intrusion Detection on IPFIX Flows

■ Snort rule:

```
alert tcp any any -> any any
(msg:"Example Alert";
content:"GET"; http_method;
content:"/evil.jpg"; http_uri;
sid:1234567; rev:0;)
```

■ IPFIX flow:

```
+--- Ipfix Data Record (id=999)
'- sourceIPv4Address
'- destinationIPv4Address
'- sourceTransportPort
'- destinationTransportPort
'- packetTotalCount
'- octetDeltaCount
+---
```

No app. layer information in IPFIX flows

IPFIX and HTTP

■ IPFIX Flow Record w/ HTTP Data:

+--- Ipfix Data Record (id=999)

```
'- sourceIPv4Address           :10.0.2.15
'- destinationIPv4Address      :93.184.138.34
'- sourceTransportPort         :50488
'- destinationTransportPort    :80
'- httpRequestMethod           : 'GET'
'- httpRequestTarget           : '/images/logo.png'
'- httpMessageVersion          : 'HTTP/1.0'
'- httpRequestHost             : 'example.com'
```

+---

IPFIX HTTP fields now standardized with IANA

Signature-based Intrusion Detection on IPFIX Flows

■ Snort rule:

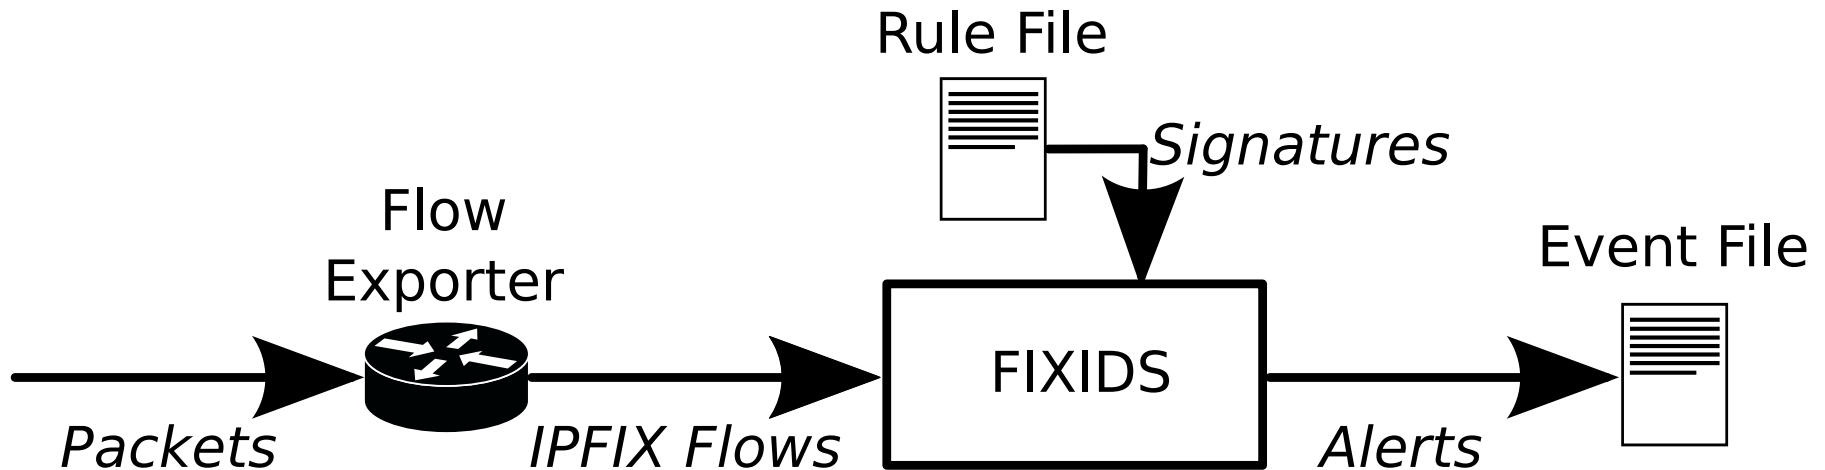

```
alert tcp any any -> any any
(msg:"Example Alert";
content:"GET"; http_method;
content:"/evil.jpg"; http_uri;
sid:1234567; rev:0;)
```

■ IPFIX flow:

```
+--- Ipfix Data Record (id=999)
+- ...
'- sourceIPv4Address
'- httpRequestMethod      :'GET'
'- httpRequestTarget     :'/evil.jpg'
'- httpMessageVersion    :'HTTP/1.1'
'- httpRequestHost       :bad.com'
+---
```

FIXIDS

- IPFIX-based signature-based intrusion detection system
 - Signature-based Intrusion Detection (using Snort signatures)
 - on IPFIX flows (using standardized HTTP IPFIX fields)

Traditional Signature IDS (Snort) vs. FIXIDS

- Snort receives packets from a switch

- FIXIDS receives IPFIX flows from a flow exporting device (e.g., switch)

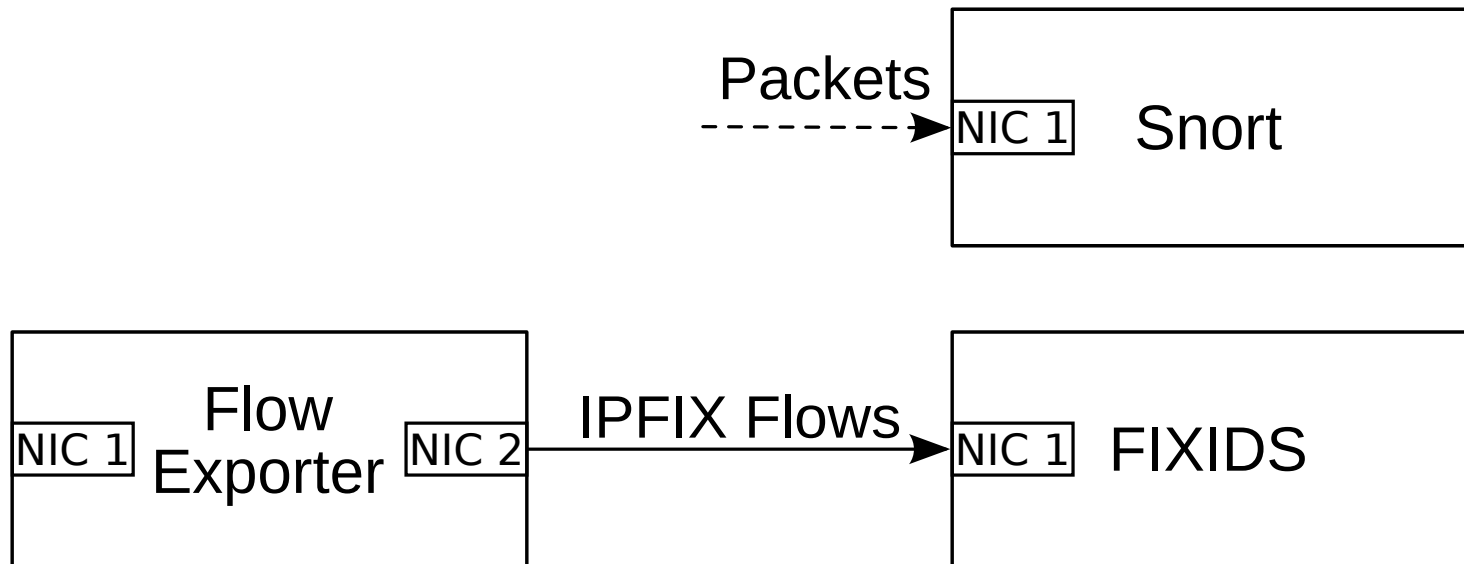

FIXIDS has to handle less than 0.5% of the data volume of Snort

Performance

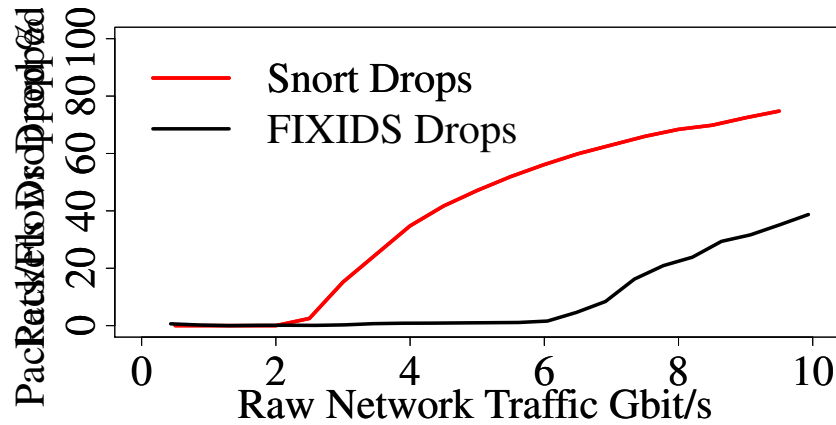

Evaluation: Experiment Setup

- Compare results of Snort and FIXIDS analyzing the same traffic, using the same signatures
- Replayed with increasing speed

Evaluation: Results

- Snort vs. FIXIDS: Same traffic, same signatures
- Replayed with increasing speed

Evaluation: Results

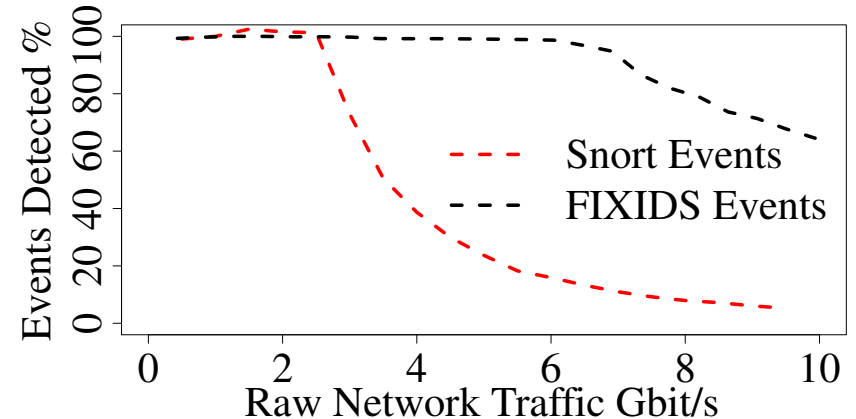

■ Snort:

- 2 Gbit/s (136k Pkts/s):
0% Drops
- 9.5 Gbit/s: >70% Drops

■ FIXIDS:

- 6 Gbit/s (14000 flows/s):
0% Drops
- 9.5 Gbit/s (22000 flows/s):
40% Drops

Testing IDS

How to test a NIDS?

- Real traffic?
 - hard to get
 - public traces: old, no payload
 - contains only very few attacks
- Manually creating attack traffic?
 - time intensive
 - cumbersome
- In general, traces do not contain enough **unique** attacks

GENESIDS

- Generating Events for Signature-based Intrusion Detection Systems
- INPUT: Set of attack descriptions
 - Snort syntax
 - HTTP attacks
- OUTPUT: Stateful network traffic containing attack patterns
 - One flow per attack
 - Annotated with an attack ID

Rule example

```
alert tcp any any -> any any (  
msg:"This is an example rule";  
content:"POST"; http_method;  
uricontent:"|2F|evil.jpg";  
pcre:"/AttackB  
sid:1234567; r
```

No.	Time	Source	Destination	Protocol	Length	Info

GENESIDS Evaluation: Goals & Rules

- Ability to generate a variety of different attacks
- Generated attacks trigger expected event

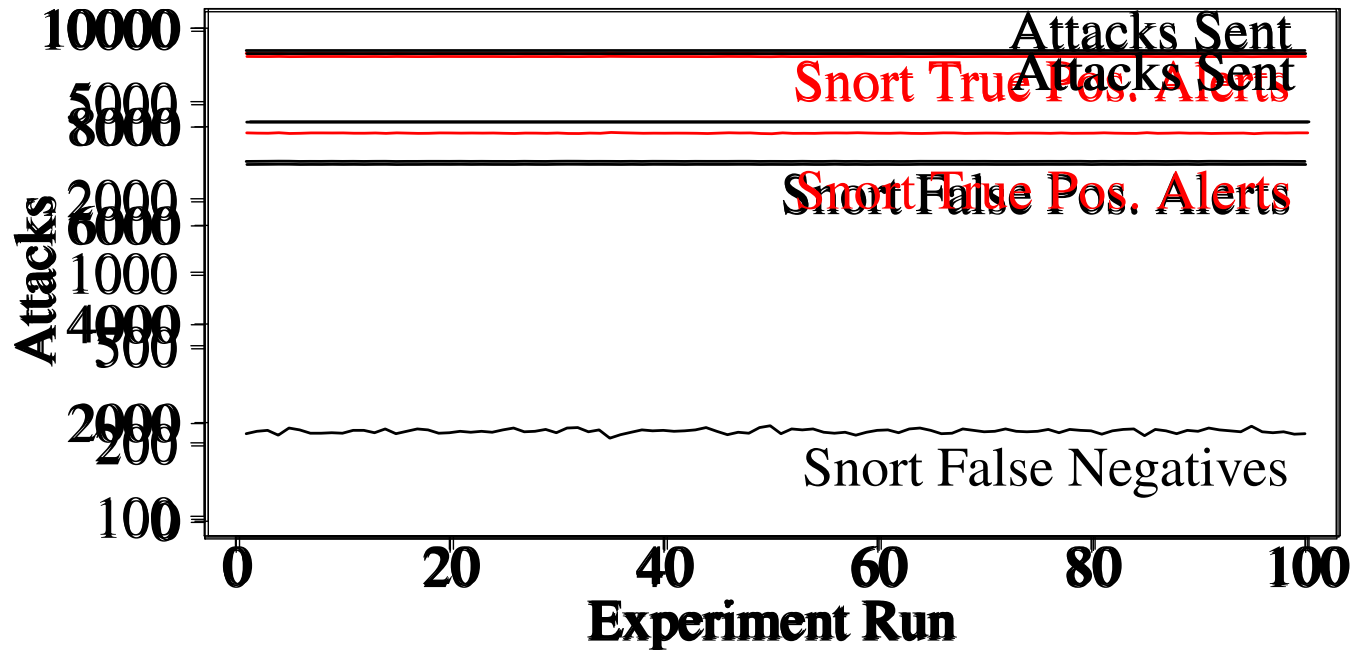

- All supported Snort rules from:
 - Snort.org subscriber rule-set
 - Snort.org community rule-set
 - Emerging Threats rule-set

- TOTAL 8101 different rules

GENESIDS Evaluation Steps

Evaluation Results: Generated Attacks

- GENESIDS: 8101 attacks generated (out of 8101 rules)
- Snort: 7877 (avg) true positive alerts triggered (out of 8101)
- Snort: 2847 (avg) false positive alerts triggered (62% triggered by 3 rules)
- Snort: 223 (avg) false negatives (generated attacks that did not trigger the corresponding alert)

Open Challenges

Network Monitoring on Encrypted Traffic

End-to-End Encrypted Connection

Interception Proxy

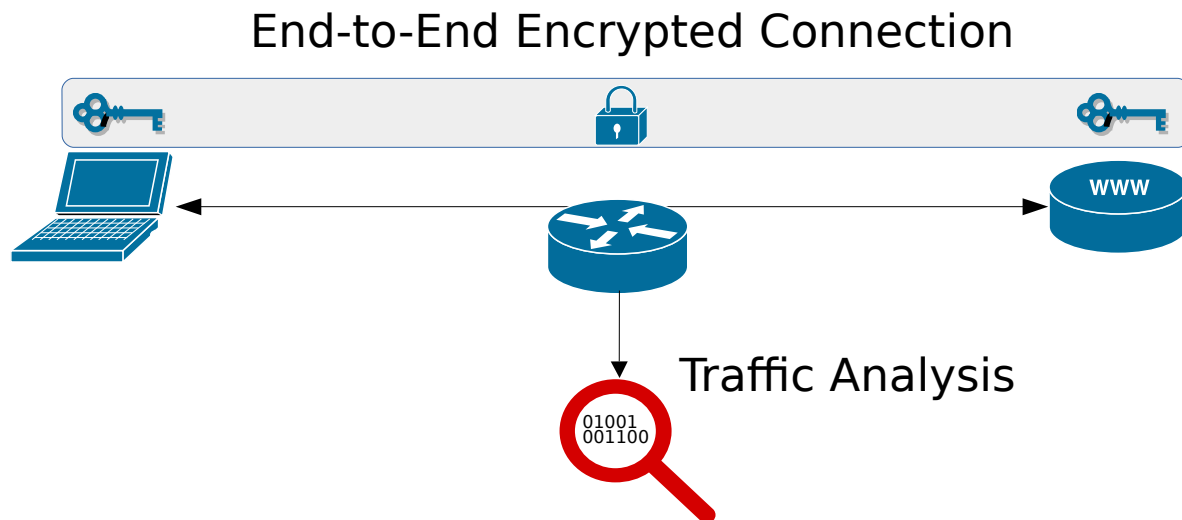

Traffic Analysis

Very performance intensive

Passive Monitoring on Encrypted Traffic

- Using statistical properties and machine learning
- Only categorization possible (e.g., application)

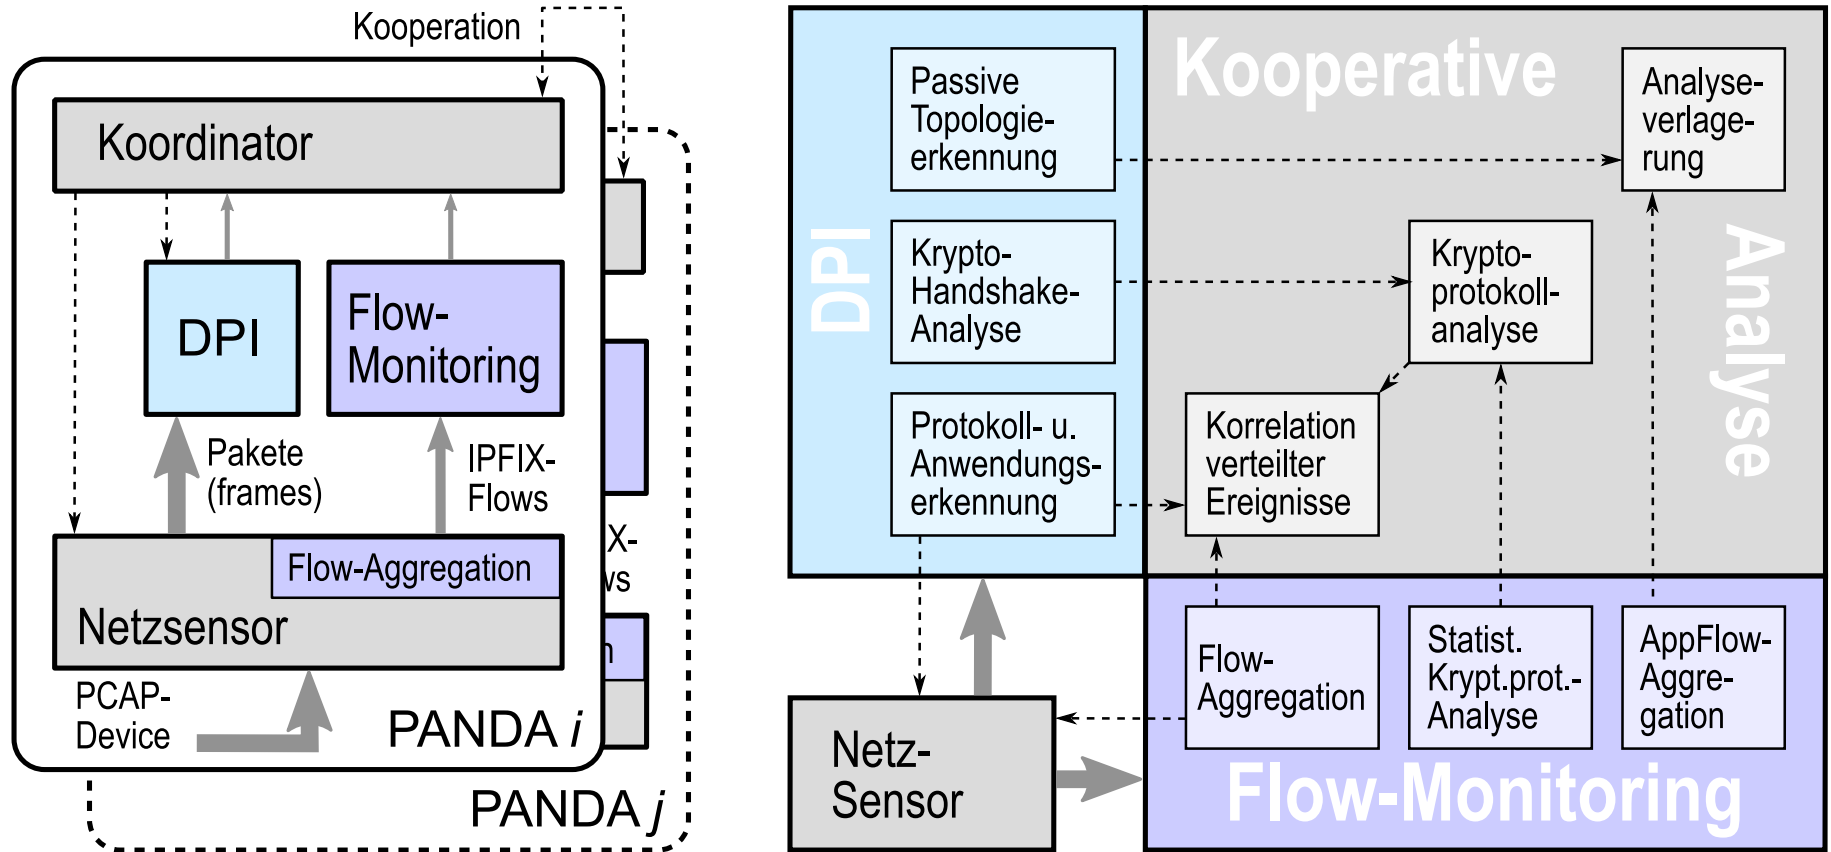

- How to passively detect malware (communication) in encrypted traffic?
- More general: How to foster strong encryption without sacrificing intrusion detection accuracy?

Where to Look for Attacks

DFG Project PANDA

PANDA – Precise Attack Detection for Network Domains by Application Classification

Conclusion

Conclusion

- Network Monitoring and IDS
 - Fundamental parts of every modern security solution
 - Flexible packet-based analysis is just too slow
- Flow-based approaches
 - Now standardized by IETF and IANA
 - FIXIDS builds directly upon this
- Unsolved so far
 - Evaluation of encrypted traffic
 - Optimal placement of probes in larger networks
- **... as can be seen, there are many open challenges and questions for another decade of interesting research 😊**
