Natural colorants

FungiColor

Natural colorants - FungiColor

Motivation

Circular bioeconomy

- Valuable products from agricultural waste streams by lignocellulose degrading fungi
- Natural alternatives for synthetic (sometimes harmfull) colorants
- Environmental friendly production of dyed materials

Applied techniques

Fermentation

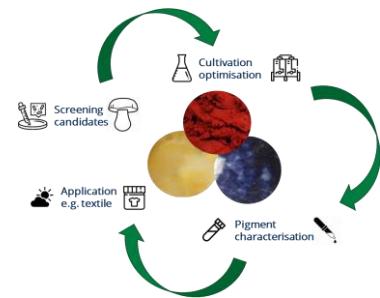

- Submerge fermentation (shake flasks, 7 L – 70 L bioreactor) → media optimization
- Emerese fermentation (agar plate to rotating drum reactor, various solid substrates)
- Process analytics (online: pH, DO, T; offline: biomass, sugar composition/concentration, TN, TOC, pigment extraction, UV-Vis)

Enzymatic assays (cellulase, xylanase, laccase)

Microscopy

Pigment application

Natural colorants - FungiColor

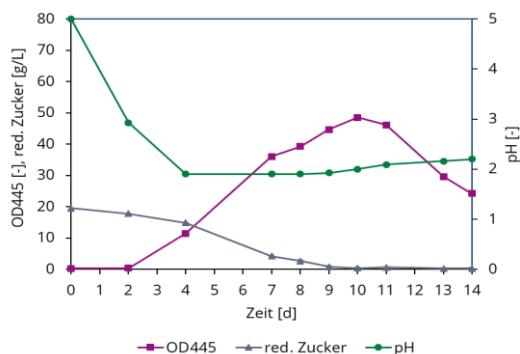

State of the project

Laetiporic acids from *Laetiporus sulphureus* (Zschätsch et al., 2021)

- Growth on agricultural waste substrates
- Submerse cultivation up to 70 L
- Pigment extraction + stability
- Pigment application (textile dyeing)

70 L upscale cultivation parameters

70 L bioreactor at harvest

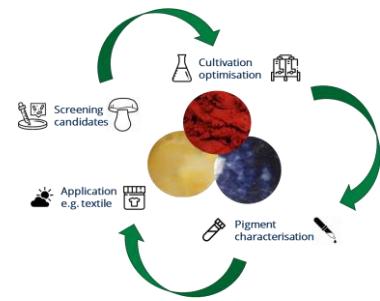

application of the pigment

Zschätsch, M., Steudler, S., Reinhardt, O., Bergmann, P., Ersoy, F., Stange, S., Wagenfuhr, A., Walther, T., Berger, R.G., Werner, A. (2021) Production of natural colorants by liquid fermentation with Chlorociboria aeruginascens and *Laetiporus sulphureus* and prospective applications. Eng Life Sci 21: 270-282

Natural colorants - FungiColor

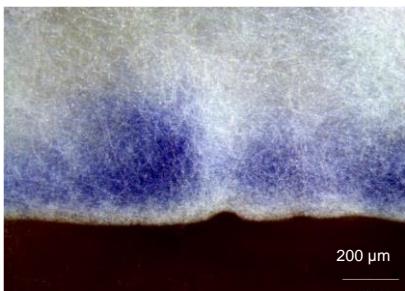

State of the project

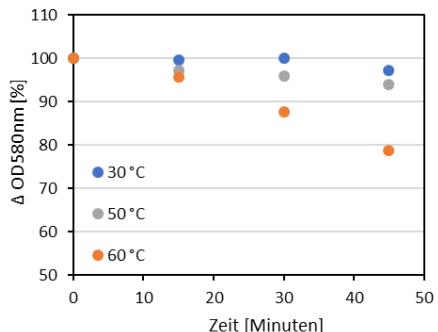

Telephoric acid from *Terana caerulea*

- Only emerge cultivation with successful pigment induction
- Biomass processing, first results on pigment extraction and stability

Pigment induction during mycelium growth

Pigment temperature stability

Application of the pigment

Further candidates of the terphenylchinone family

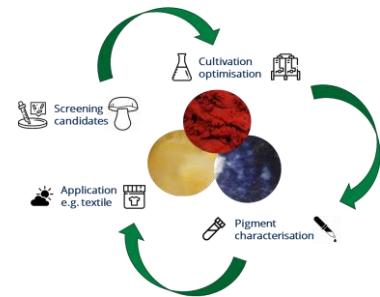

- Forschungspraktikum Martin Schuster (till June 2022)

Natural colorants - FungiColor

Open topics

Terana caerulea

- Identification of pigment-producing submerse cultivation conditions
- Detailed analysis of pigment extraction/stability and application

other candidates

- Media optimisation to increase pigment production
- Upscale: 70 L submerse cultivation
- Analysis of pigment extraction/stability and application
