

Chair of Bioprocess Engineering

# Synthetic biology applied to production of the Methionine Analogon HMTB

M.Sc. Nadine Ihle

Dipl.-Ing. Stefanie Nguyen

# Motivation

## Two-stage process for the production of HMTB

(1) <https://www.feedinfo.com/> (11/2019)

HMTB: 2-hydroxy-4-(methylthio)butyrate  
DHB: 2,4-dihydroxybutyric acid

# Methods

## For microbial synthesis of DHB

### Enzyme engineering

- Targeted mutagenesis
- Random mutagenesis and directed evolution

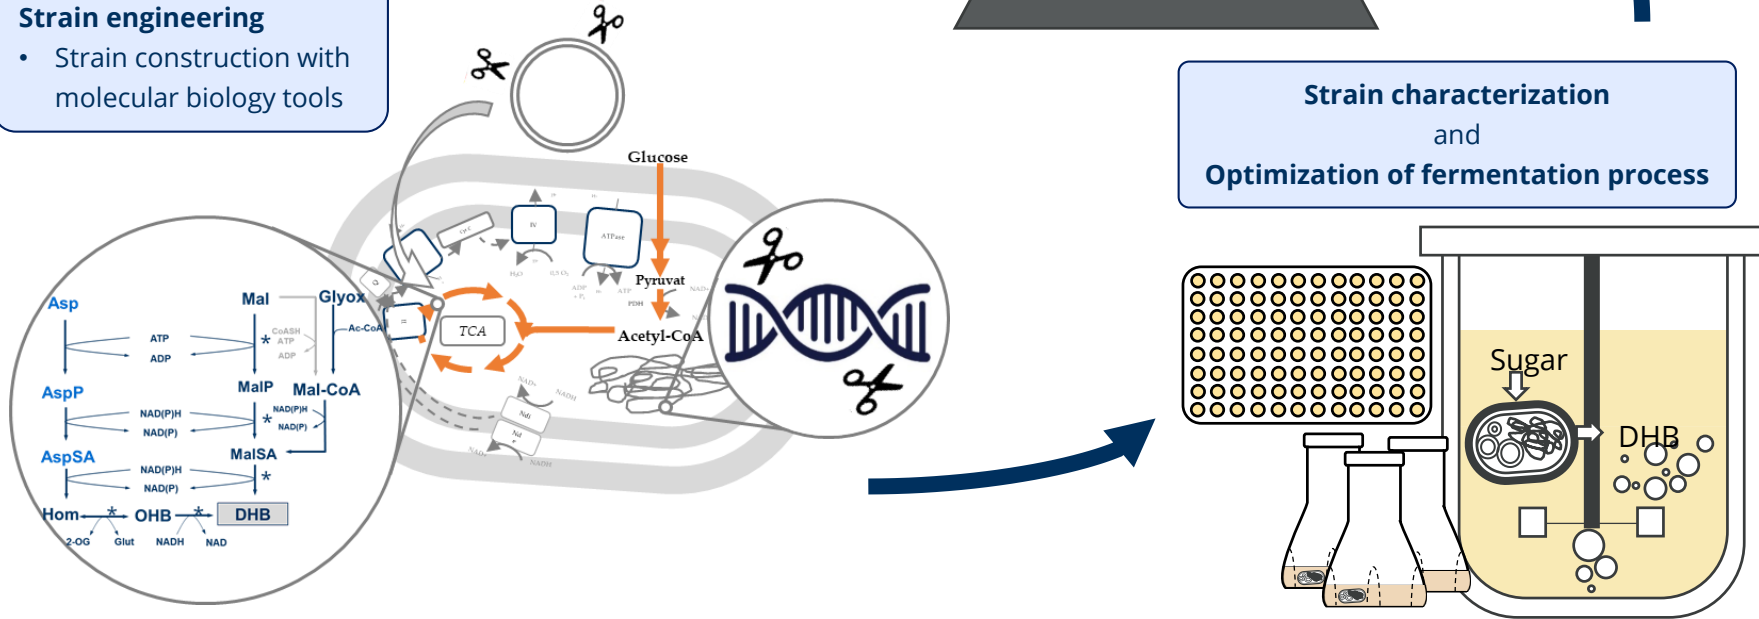

### Strain engineering

- Strain construction with molecular biology tools

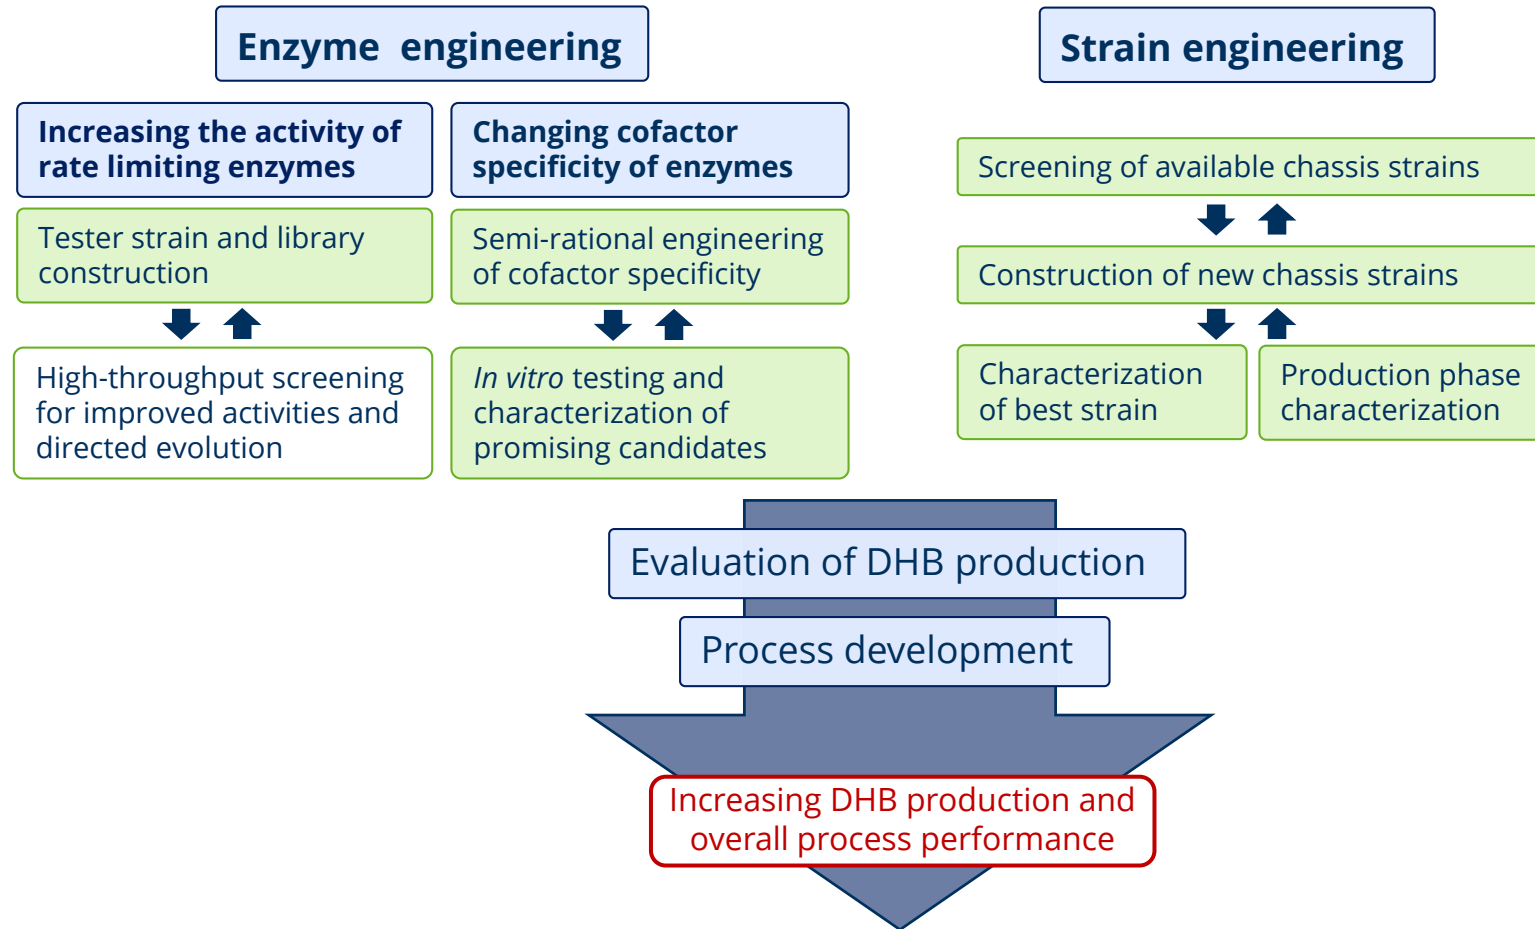

### Computational design

- Semi-rational enzyme engineering
- Analysis of cellular networks

### Strain characterization and Optimization of fermentation process

# State of project

# Possible research topics for students

## Enzyme engineering

Molecular biology including cloning/plasmid construction, targeted and random mutagenesis, enzyme assays, development of high throughput enzymatic assays

## Strain engineering

Metabolic engineering:

from conceptual planning to actual strain construction using molecular biology

Strain characterization/Fermentation

$^{13}\text{C}$  metabolic flux analyses using mass spectrometry, optimization of fermentation processes

**All topics are suitable for Internships/Bachelor/Master/Diploma projects**
