Speaker **Arnab Bose**

Johannes Gutenberg Universität Mainz

Title **Generation of electric-field-induced unconventional spin current**

Abstract Efficient generation of spin current is one of the primary goals of spintronics. In the first part, I shall talk about the electric-current-driven unconventional spin-current generation [1] using the novel spin-split bands of altermagnet RuO₂ [2], which could be a potential root to achieve the field-free switching of perpendicular magnet for high-density memory applications. In the next part of my talk, I shall discuss our recent results of thermal generation of spin current due to the spin Nernst torque of heavy metals such as Pt and W [3], which could be useful for energy harvesting spin-caloritronic research applications.
