**Titel:** 'Spontaneous' cancer regressions: lessons for therapy and prophylaxis

**Referent:** Prof. Dr. Heinz-Uwe Hobohm  
FH Giessen-Friedberg

**Kurzfassung:**

Spontaneous regressions from cancer are still regarded as a mystery. But a closer look reveals that many, if not a majority of cases have a link in time with a hefty feverish infection. This observation will be aligned with epidemiological findings – a personal history of infections has a protective effect with respect to cancer – and old experiments, where some late stage cancer patients were successfully treated using bacterial extracts. Implications for therapy and prophylaxis will be discussed.

**Ort:** Visitor Center, Trefftz-Bau, HRSK 101  
Zellescher Weg 12, 01069 Dresden

**Zeit:** Mittwoch, 16. April 2008, 16:00 Uhr
